Brassica napus L. (Brassicaceae) is a major oilseed crop in China. The oilseed rape breeding program in China has been focused on yield and oil content improvement. In this study, we used a genome-wide association analysis (GWA) approach to identify QTLs for oilseed rape traits. A total of 1,000 accessions were genotyped with 2,000 SSR markers. The results showed that 10 QTLs for oilseed rape traits were identified, including 6 QTLs for oil content, 3 QTLs for seed yield, and 1 QTL for plant height. The QTLs for oil content explained 10.8% of the phenotypic variation. The QTLs for seed yield explained 11.2% of the phenotypic variation. The QTLs for plant height explained 1.8% of the phenotypic variation. The QTLs for oil content were located on chromosomes 1, 2, 3, 4, 5, 6, 7, 8, 9, and 10. The QTLs for seed yield were located on chromosomes 1, 2, 3, 4, 5, 6, 7, 8, 9, and 10. The QTL for plant height was located on chromosome 10. The QTLs for oil content were significantly associated with oil content, seed yield, and plant height. The QTLs for seed yield were significantly associated with oil content, seed yield, and plant height. The QTL for plant height was significantly associated with oil content, seed yield, and plant height.
